

Ethereum-Solidity Quiz Q5: What Is The Private Mempool?

Technology

December 26, 2025 Admin Leave A Comment

We have previously established what a mempool is, a list of pending transactions, specific to each blockchain node, where new created transaction wait to be verified, included in a transaction block and executed on the blockchain.

The transactions with lower gas prices spend more time in a mempool and can be overwritten with replacement transactions. One of the most uses of the Mempool is to get pending transactions in real time. Here's why monitoring the mempool can be important:

A private mempool sends the transactions to a smaller number of nodes, that promise to keep transaction data private and don't intervene in transaction's ordering.

Advantages of privates mempools are better privacy, lower MEV risks and better control in transactions ordering. The trade-off to these benefits can be lower execution times due to fewer nodes, but generally considered a small inconvenient considering the privacy benefits.

Templates let you quickly answer FAQs or store snippets for re-use.
